Using the index

Subject Index

A string of keywords is provided for each abstract. Each primary term of the keyword string has a separate entry in the index, and appears with the other elements of the string (other primary terms plus qualifiers) followed by any organism and regional terms from the abstract. The number **immediately following** is the reference number for the abstract.

Where a keyword has been used more than once, entries under this keyword are blocked and sorted in alphabetical order by the second keyword. For example:

crustacean

agonistic behaviour, courtship, Neocallichirus manningi, Arabian Sea; 00698.
antipredator behaviour, ... etc.

All the index terms are chosen by the editor and are mostly selected from the ASFA thesaurus, so a reasonable degree of consistency can be expected. Please note that English spelling variants have been used throughout.

Author Index

Each of the first three authors is indexed separately from co-authors, each entry being followed by one or more abstract reference numbers. Please remember to check for listings under various possible combinations of initials.

In cases where there are more than six authors, we list the first one cited followed by '& others', so only the first author will appear in the index.

Although in general only the last name is indexed as the surname, in certain cases each separate element of a surname will have an entry. These are: where surnames contain prefixes, e.g. De; where Latin surnames contain both parental names, e.g. Garcia Chavelas, C.; where Chinese and some Indo-Chinese names are used; e.g. Huang Jinbiao. If in doubt, check all possibilities.

Organism Index

The terms in the organism index are included in the subject index string to give a cross-reference between local and scientific names. The listing in the organism index allows the searcher to locate articles through the whole coverage of **Oceanographic Literature Review** on a particular group, genus or species.

Regional Index

Although regional index terms are added to the keyword string within the subject index, there is now also a separate regional index. This operates on a hierarchical system. Under each country (or broader regional term where appropriate) the terms are progressively indented to the right, to indicate increasing specificity, and the string is only complete when an abstract reference number appears. Coastal areas are indexed under country. Shelf, slope and oceanic areas are indexed under the respective gulf, sea, or ocean.

This is a simple alphabetical listing of the periodicals cited in **Oceanographic Literature Review** during 1994. A full listing of the 3000 or so journals scanned by Elsevier/Geo Abstracts is available from the publisher.
